

Well, I hope I have the right scientific name for this red wolf. It's based off of a printout of a photo from a website that I lost the URL's for, given to me by a very decent prison psychologist whom I think it's best not to identify. (Decent staff are frowned upon...). It took me two weeks to draw it out, which I did while in the S.H.U. at Allenwood & then Coleman 1.

This is just a photocopy. You can see a good scan of the original, along with other art of mine, at prisoninmates.com/NateLindell99582-555. Please "like" it on facebook & "share" it! :) Thanks.

Some guys in S.H.U. do Sudukos, others do crossword puzzles, but I enjoy the challenge of accurately drawing a cool picture. And I have a love of wolves, as well as figers.

Red wolves are, on the canine spectrum, in between the larger timber wolves and the smaller coyote. They often have some red hairs in their coats.

A curious fact about wolves - the males don't bite females, even when attacked by females. At least in their own packs. Enjoy, Nate.
