

Coronavirus Mass Quarantine

The process

I know everyone has been educated on the Coronavirus. For the ones who don't know what is going CoronaviruS is a respiratory illness that can spread from person to person. It spreads the same way the flu and other respiratory diseases spread through respiratory droplets produced when ~~an~~ an infected person coughs or sneezes. Patients with covid-19 have mild to severe respiratory illness with symptoms of fever, cough and shortness of breath. In severe cases, patients with covid-19 have developed pneumonia in both lungs. This subject is very important to me. Because I have a history of asthma. I feel like the ones that has a low immune system. Such as asthma and ~~COPD~~ ^{COPD} is a very sure target.

~~But~~ I have had a history of flu, ~~bronchitis~~ Bronchitis, ~~and~~ upper respiratory infection and Pneumonia. It has been through the severe respiratory illness with ~~symptoms~~ symptoms of fever, cough and shortness of breath. So I been paying attention to the process of how the doctors and hospital has been handling. When I was younger I was in the hospital a lot. They use to place me in a Oxygen Tent in a room by myself. The room was extremely cold. My mom was a nurse so at the house. I had humidifier to circulate the heat and air temperature because straight heat would make me sicker cause my ~~respiratory~~ respiratory illness were. My mom would make me go outside for a while to get air as well. Do you know why it's was so important to keep air circulating. It's kills off the germs. heat is dangerous in environment like this. Heat is a form of energy associated with the motion of ~~atoms~~ atoms or molecules and transferred from a body at higher temperature to one at a lower temperature. Remember the guy on the cruise ship was saying his body temperature was getting higher every day. Where he was located was not cold enough and was not getting enough outside air. He said they wasn't let them out of the ship on deck in a small amount of time. yes heat can kill off something but respiratory illness is not one of them. Heat suffocate the germs cause the spread because of the ~~extreme~~ motion of the atoms or molecules

Where air has a lesser amount of other gases. Air is a mixture with varying amounts of moisture and particulate matter, enveloping earth. The atmosphere. We can germicide the germs all we want to and wash our hands. But if the environment is not cold the germs is going to continue spread. That is why the people in the same area of establishment logetting it. Whether it's in a home or office or plane etc. I hate so many people has lost their lives as of poor process dealing with the covid-19. Another thing people has to realize if they are in a individual setting like your home. When we have flu symptoms. Then chills come. We switch from heat to air. To accomodate your body temperature. That is the worst thing you can do. It will cause your lungs to shut down, you need to keep that room cold at all times. As if you are hospitalized. I am talking from past experience. You ~~help~~ have to help your own recovery. Can't totally depend on us. ~~good~~ I know I have asthma. So I have heat but their is some air circulating enough to kill Germs before they even grew. I have bunkmate sometimes they get sick with a cold. Don't fear the coronavirus just take care of you.

Attn viewers I am trying to get published and get one of my stories in a movie. I don't have the funds to pay a secretary right now. Once I hit the peak, I will pay you. I had someone to type up the story and make a tons of copies so I can mail to the publisher and producers.

Thank you

Jennifer Johnson
